

Fiberglass Tanks

Permian Tank and Manufacturing Inc began operations in 1976 as a steel fabricator and added a separate fiberglass tank division in 1985, mainly to meet the needs of the petrochemical industry. In the last decade, we have diversified our product line and have become established as a major manufacturer of fiberglass products in the Southwest.

Permian Tank maintains a large inventory of standard products to ensure quick delivery, often within a matter of days. We specialize in quality workman ship and an ability to customize tanks and other products for any purpose. Each product is individually inspected and hydro-tested. Our Fiberglass tanks and other products can be gel-coated in company colors and customized with striping or logos, or colorized to blend in with the location surroundings.

Fiberglass tanks are commonly used for petrochemical, agricultural, industrial and environmental containment purposes. Tanks are manufactured specifically to hold a variety of products such as oil, potable or salt water, acids, chemicals, fertilizers and food/drink products. Because of the versatility of fiberglass and the availability of various corrosion control and containment coatings, our products are especially recommended for use in environmental applications, i.e, hazardous waste containment.

We deliver our fiberglass products with Permian Tank fleet trucks and will install tanks on customer's location. The staff at Permian Tank are ready to respond to your call.
